0.1 # Stock Price Prediction - LSTM

@author: Stefan Su

@date: 2023-04-28

@Lisence: MIT Lisence

0.2 1. Retrieve Data

Use `pandas_datareader` to retrieve historical and present stock price by ticker and time range. Here, I choose “GOOGL” as an example, but in the real data product, customer can choose whatever valid stock ticker they want to do prediction.

(Reference [pandas_datareader](#) link)

1.1 Import required libraries

```
[39]: import pandas_datareader.data as web
import pandas as pd
import datetime
import os
from sklearn.preprocessing import StandardScaler
from sklearn.model_selection import train_test_split
from collections import deque
import numpy as np
import tensorflow as tf
from tensorflow.keras.models import Sequential, load_model
from tensorflow.keras.layers import LSTM, Dense, Dropout
from tensorflow.keras.callbacks import ModelCheckpoint
import matplotlib.pyplot as plt
```

1.2 Set start time and end time as parameters to retrieve data.

```
[2]: start = datetime.date(2000, 1, 1)
end = datetime.date.today()
print(start, end)
```

2000-01-01 2023-04-28

1.3 Get origianl real-time data from DataReader.

```
[3]: ticker = 'GOOGL'
df = web.DataReader(ticker, 'stooq', start, end)
df
```

```
[3]:
```

1.5 Create label column as prediction value. We want to know the price/trend of the stock 10 days later.

- pre_days: prediction days

```
[5]: pre_days = 10
df['label'] = df['Close'].shift(-pre_days)
df
```

```
[5]:
```

	Open	High	Low	Close	Volume	label

[4704 rows x 6 columns]

0.3 2. Data Preprocessing

2.1 Standardize the data

Use StandardScaler to complete data standardization.

```
[6]: scaler = StandardScaler()
scale_X = scaler.fit_transform(df.iloc[:, :-1])
print(scale_X)
```

```
[[-1.02020079 -1.01728517 -1.0229223 -1.0198426  5.09758988]
 [-1.01949078 -1.01379531 -1.01969465 -1.01424127  2.20909426]
 [-1.01264371 -1.01073647 -1.01361617 -1.01347522  1.60316942]
 ...
 [ 1.88523364  1.87717209  1.86179288  1.82907598 -0.50453024]
 [ 1.85978561  1.86771749  1.82738366  1.82514029 -0.46034686]
 [ 1.8465695   1.92388895  1.85326166  1.9342151  -0.48188751]]
```

2.2 Set train & test data

- `mem_his_days`: memory of history days
- `deq`: a first in first out data structure, which make sure only remember and store the length of `mem_his_days` stock price data.
- `X`: train set, which means `mem_his_days` days of stock price data in each element and excludes last ten records. (refer to see `pre_days`)
- `X_lately`: last ten records.
- `y`: test data, which names 'label' in dataframe.

```
[7]: mem_his_days = 5
deq = deque(maxlen=mem_his_days)

X = []
for i in scale_X:
    deq.append(list(i))
    if len(deq) == mem_his_days:
        X.append(list(deq))

X_lately = X[-pre_days :]
X = np.array(X[: -pre_days])

y = np.array(df['label'].values[mem_his_days - 1: -pre_days])
```

```
[8]: print(X.shape)
print(y.shape)
```

```
(4690, 5, 5)
(4690,)
```

2.3 Train Test set split

```
[9]: X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.1)
```

0.4 3. Generate and Train LSTM Neural Network

3.1 Add LSTM layers Reference [LSTM link](#) 1. The first layer should have `return_sequences` and define the `input_shape` 2. Repeat add LSTM and Dropout .1 percent data to generate the second and third layers. Remember to remove `input_shape` and `return_sequences` parameters in the last layer since it is defined at the layers before. 3. Add a fully connected layer, and an output layer. 4. Compile the model and use 'adam' as optimizer, use [keras MSE](#) as loss function, [keras MAPE](#) as metrics.

```
[10]: model = Sequential()

# The first layer of Recurrent Neural Network should have return_sequences and
# define input shape
model.add(LSTM(10, input_shape=X.shape[1: ], activation='relu',
# return_sequences=True))

# To avoid overfitting, use Dropout to remove .1 data
model.add(Dropout(0.1))

# Repeat to generate second and third layers
model.add(LSTM(10, activation='relu', return_sequences=True))
model.add(Dropout(0.1))
model.add(LSTM(10, activation='relu'))
model.add(Dropout(0.1))
```

```

# Generate Fully Connected layers
model.add(Dense(10, activation='relu'))
model.add(Dropout(0.1))

# Output layer
model.add(Dense(1))

# Compile model
model.compile(optimizer='adam', loss='mse', metrics=['mape'])

```

3.2 Train LSTM model

Note: The parameters of the model are not modified and polished. And it does not mean the model is perfect and we can find that the model become overfitted during the training process.

```

[11]: model.fit(X_train, y_train, batch_size=32, epochs=50, validation_data=(X_test,
    ↪y_test))

```

```

[11]: <keras.callbacks.History at 0x7f4338523190>

Based on the results above, we notice the model should be optimized to find the best set of parameters which can provide a better prediction output. But before that, we should encapsulate data process part into one function.

0.5 4. Encapsulate data process function

Different mem_his_days, pre_days and df will influence train result.

```

[12]: def stock_price_LSTM_data_processing(df: pd.DataFrame, mem_his_days: list,
      ↪pre_days: list):
      df.dropna(inplace=True)
      df.sort_index(inplace=True)

      df['label'] = df['Close'].shift(-pre_days)

      scaler = StandardScaler()
      scale_X = scaler.fit_transform(df.iloc[:, :-1])

      deq = deque(maxlen=mem_his_days)

```

```

X = []
for i in scale_X:
    deq.append(list(i))
    if len(deq) == mem_his_days:
        X.append(list(deq))

X_lately = X[-pre_days :]
X = np.array(X[: -pre_days])

y = np.array(df['label'].values[mem_his_days - 1: -pre_days])

return X, y, X_lately

```

Try to call the function and pass df=df, mem_his_days=5, pre_days=10.

```

[13]: X, y, X_lately = stock_price_LSTM_data_processing(df=df, mem_his_days=5,
↪pre_days=10)
print(X[0])
print(len(X) == len(y), len(X_lately))

```

```

[[-1.01893333 -1.01603035 -1.02167181 -1.01859431  5.0928282 ]
 [-1.01822142 -1.01253104 -1.0184355  -1.01297783  2.20632025]

```

True 10

0.6 5. Optimize Model

5.1 Create list of mem_days, lstm_layers, dense_layers, units, and iterate them one by one to figure out the best set of parameters.

- mem_days: memory days
- lstm_layers: number of different LSTM layers
- dense_layers: number of different dense layers
- units: number of different neurons in each layer

NOTE: the algorithm here is brute force. We can optimize it by using grid search in the future if you want.

```

[14]: # Self-defined
mem_days = [5, 10, 15]
lstm_layers = [1, 2, 3]
dense_layers = [1, 2, 3]
# units = [8, 16, 32]
units = [8, 16]

```

5.2 Find best model during the iteration Use `ModelCheckpoint` in Keras Callbacks API to find the best model in each training iteration. Reference [keras Callbacks API ModelCheckpoint](#).

How many epochs should I train my model with?

- The right number of epochs depends on the inherent perplexity (or complexity) of your dataset. ***A good rule of thumb is to start with a value that is 3 times the number of columns in your data.*** If you find that the model is still improving after all epochs complete, try again with a higher value. If you find that the model stopped improving way before the final epoch, try again with a lower value as you may be overtraining. If you have only a small number of records in your dataset or are having a large number of records fail validation, you may need to increase the number of epochs significantly to help the neural network learn the structure of the data. (Reference [How many epochs should I train my model with?](#))

```
[51]: """
      Run the code below if you want to run the train again

      import shutil
      shutil.rmtree('./models')
      """
```

```
[51]: "\nRun the code below if you want to run the train again\n\nimport
      shutil\nshutil.rmtree('./models')\n"
```

Note: It takes a really long time to run it more than 2 hours. You can use keyboard to interrupt it and continue to run other cells. It works well even if with an interruption. (Recommmand run at least 20 minutes)

```
[17]: count_1, count_2, count_3, count_4 = 0, 0, 0, 0
      for mem_day in mem_days:
          for lstm_layer in lstm_layers:
              for dense_layer in dense_layers:
                  for unit in units:
                      filepath = f'./models/{ticker}_' + '{val_mape:.2f}_{epoch:
↪02d}_' + f'mem_{mem_day}_lstm_{lstm_layer}_dense_{dense_layer}_unit_{unit}'
                      checkpoint = ModelCheckpoint(
                          filepath=filepath,
                          save_weights_only=False,
                          monitor='val_mape',

```

5.3 Load Best Model Use `os` module to get all sub-folders in the model folder and find the minimum value of MAPE, which is the best model. Get the name of that folder as model name we are going to load. Use `load_model` to load the best model, and in this name of model folder, we can easily figure out all parameters this best model use. Reference [keras load_model link](#)

5.3.1 Find the model name with minimum value of MAPE

```

[34]: dir_list = os.listdir('./models')
mape_list = []
for dir in dir_list:
    if dir.__contains__('checkpoints'):
        continue
    else:
        mape_list.append(float(dir.split('_')[1]))

```

```

min_mape = min(mape_list)
best_model_name = ''
for dir in dir_list:
    if dir.__contains__(str(min_mape)):
        best_model_name = dir
        break

```

5.46

GOOGL_5.46_11_mem_5_lstm_1_dense_1_unit_8

5.3.2 Load Best Model

```
[36]: best_model = load_model(f'./models/{best_model_name}')
```

```
[37]: best_model.summary()
```

Model: "sequential_2"
